OLDER PATIENT'S KNOWLEDGE AND BEHAVIOR LEVEL DESCRIPTION OF ACUTE GASTROENTERITIS AT PRIVATE HOSPITAL IN WEST INDONESIA

(xv + 53 pages: 2 charts; 9 table; 7 appendix)

Acute Gastroenteritis (AGE) is an inflammatory disease of the gastrointestinal tract that can infect and spread easily and has a high rate of morbidity and mortality especially in developing countries such as Indonesia. One way to manage the AGE disease is to increase the knowledge and behavior of the patient. The purpose of this study is to determine the level of knowledge and behavior of patient about AGE disease in the inpatient wards. The type of this research is quantitative descriptive with the population of all adult patients who experienced AGE and the sample obtained by technique "Total Sampling" as many as 30 respondents and data collection using questionnaire that has been examine on validity and reliability. This study was conducted on June 2018 until July 2018. The results showed that, from 30 respondents of adult patients who experienced AGE treated in private hospital in western Indonesia there were 12 respondents (40%) who had good knowledge, 12 respondents (40%) was moderate and 6 respondents (20%) had less knowledge. Based on the behavior, it was found that 23 respondents (77%) had good behavior and 7 respondents (23%) was moderate. From the overview of the overall results of the description of the level of knowledge and behavior of adult patients on Acute Gastroenteritis disease in the private hospital wards in West Indonesia, the respondents showed good knowledge and behavior toward the illness.
