THE EFFECT OF PERCEIVED SOCIAL SUPPORT AND SELF-ESTEEM ON LATE TEENAGE GIRLS WHO HAVE EXPERIENCED DATING VIOLENCE

(xi + 35 pages; 10 tables; 3 pictures; 13 appendices)

Dating is a process of getting to know between two peoples who have a serious life goal, such marriage or have a family. Some couples face a conflict, but there are some couples who find it difficult to resolve the conflict and it leads to violence. In this study, researchers wanted to look at the self-esteem on late teenage girls who had experienced violence in relationship who are influenced by the perceived social support. The sampling technique used are purposive sampling and the number of samples is 60 peoples. Retrieval of data using the Scale of Perceived Social Support(MSPSS), Rosenberg Self-Esteem Scale (RSES), and Woman Abuse Scale Tools (WAST). The results of the regression test in this study showed that there was a 21.8% effect of perceived social support on self-esteem. Perceived social support has a significant relation with self-esteem on late teenager who have experienced dating violence.
