Designing Application for Filtering Cash and Electronic Data Transaction at PT Primacom

(xiv + 69 pages: 47 figures; 1 table)

PT Primacom Interbuana is a company that moves on the field of banking, the main service of the company is PRIMA network, which enables a customer from a different bank to check his/her account on an ATM owned by a different bank.

The problem arises from the need for a full report of transaction for evaluations where the process of creating a single report can take from 3 to 4 weeks of working time. This problem surfaces because of the trouble to find the needed data and later to use the data.

The solution given for the problem is to create a program which can easily access the database to acquire the needed data and later to output the data to a special file for later use.
